▶ Abstract

Objectives: To identify changes since 1994 in the prevalence of resistance to anti-HIV drugs in primary HIV-1 infections in the United Kingdom.

Design: Retrospective and prospective assessment of viruses obtained from people recently infected with HIV.

Setting: Multiple centres (patients enrolled in the UK register of seroconverters) and a single large HIV clinic (active case ascertainment).

Participants: 69 patients infected with HIV between June 1994 and August 2000.

Main outcome measures: Prevalence of key mutations associated with drug resistance in the reverse transcriptase and protease genes of HIV-1, by

Modulation of Endothelial Cell Growth Arrest and Apoptosis by Vascular Endothelial Growth Inhibitor

Jingyi Yu , Song Tian , Linda Metheny-Barlow , Li-Jin Chew , Andrew J. Hayes , Hongguang Pan , Guo-Liang Yu , and Lu-Yuan Li *

From the Department of Oncology (J.Y., S.T., L.M.-B., L.-J.C., A.J.H., H.P., L.-Y.L.), Georgetown University Medical Center, Washington, DC, and Mendel Biotechnology (G.-L.Y.), Hayward, Calif.

Vascular endothelial growth inhibitor (VEGI), a new member of the tumor necrosis factor family, is an endothelial-specific gene and a potent inhibitor of endothelial cell proliferation, angiogenesis, and tumor growth. We report here that VEGI mediates the following two activities in endothelial cells: early G₁ arrest in G₀/G₁ cells responding to growth stimuli, and programmed death in proliferating cells. G₀/G₁-synchronized bovine aortic endothelial cells were treated with VEGI before and after the onset of the growth cycle. When the cells were stimulated with growth conditions but treated simultaneously with VEGI, a reversible, early-G₁ growth arrest occurred, evidenced by the lack of late G₁ markers such as hyperphosphorylation of the retinoblastoma gene product and upregulation of the *c-myc* gene. Additionally, VEGI treatment led to inhibition of the activities of cyclin-dependent kinases CDK2, CDK4, and CDK6. In contrast, VEGI treatment of cells that had entered the growth cycle resulted in apoptotic cell death, as evidenced by terminal deoxynucleotidyl transferase labeling of fragmented DNA, caspase 3 activation, and annexin V staining, all of which were lacking in nonproliferating cells treated with VEGI. Additionally, stress-signaling proteins p38 and JNK were not as fully activated by VEGI in quiescent as compared with proliferating populations. These findings suggest a dual role for VEGI, the maintenance of growth arrest and induction of apoptosis, in the modulation of the endothelial cell cycle.

Istyna Scientific Methodological Medical Ultrasound Center

Kyiv, Ukraine

ABSTRACT

Vascular pathologies constitute a significant part of human's diseases and their rate tends to increase. Numerous investigations of brain blood flow in a normal condition and in a pathological one has created a new branch of modern medicine - angioneurology. It combines the information on brain angioarchitecture and on blood supply in a normal condition and in a pathological one. Investigations of a disease's development constitute an important problem of a modern medicine.

Cerebrum blood supply is regulated by arterial inflow and venous outflow, but, unfortunately, in the literature available arterial and venous beds are considered separately. This causes an one-sided interpretation of atherosclerotic and discirculatory encephalopathies. As arterial inflow and venous outflow are interrelated, it seems to be expedient to perform a complex estimation of arteriovenous interactions, prove a correlation dependence connection between the beds and find a dependence in a form of mathematical function. The results will be observed clearly in the graphs.

There were 139 patients aged from 2 up to 70 examined in the "Istyna" Scientific Medical Ultrasound Center by means of a Logidop 2 apparatus manufactured by Kranzbühler, Germany using a technique of cerebral arteries and veins ultrasound location (invented and patented by Ulyana Lushchik, State Patent of Ukraine N10262 of 19/07/1995). A clinical interpretation of the results obtained was performed.

With the help of this technique and ultrasound Dopplerography the blood flow in major head and cervical arteries was investigated. While performing a visual graphic analysis we paid attention to the changes of carotid artery (CA), internal jugular vein (IJV) and supratroclear artery's (STA) hemodynamical parameters. Generally accepted blood flow parameters: FS - maximal systolic frequency and FD -

Abstract

Objective: To assess the efficacy and safety of interferon alfa with or without ribavirin for treatment of chronic hepatitis C.

Design: Systematic review of randomised trials on interferon alfa plus ribavirin combination therapy versus interferon alfa. Patients were naive (not previously treated with interferon), relapsers (transient response to previous interferon therapy), or non-responders (no response to previous interferon therapy).

Studies reviewed: Of 1155 references identified, 48 trials with 6585 patients met the inclusion criteria. Patients were followed to the end of treatment in 20 trials and in 28 trials for 12-96 weeks after treatment.

Main outcome measures: Virological response and morbidity plus mortality

Prenatal diagnosis of Down's syndrome

Fetus with trisomy 21

Use of invasive tests such as amniocentesis or chorionic villus sampling for prenatal diagnosis of Down's syndrome (to look for trisomy 21—a chromosome abnormality) carries a 1% risk of miscarriage. New research shows that looking at the fetal profile during ultrasound examination may provide a safer alternative—by checking for the presence of the nasal bone. In a UK study published in *The Lancet* this week, Simona Cicero and colleagues report that the nasal bone was visible in 99.5% of chromosomally normal fetuses. If the mother's age and nuchal translucency (a measurement of part of the baby's neck) are also taken into account, the sensitivity of the method would increase and the false-positive rate would decrease, they say. But they caution that

I registri di sperimentazioni cliniche

A decorative graphic on the right side of the slide. It features a large, solid blue circle. To its left, a grid of small blue squares is arranged in a pattern that appears to be receding or fading into the background, creating a sense of depth and movement.

Registri di sperimentazioni cliniche - Cosa sono

- Database liberamente accessibili su Internet
- Forniscono informazioni sui protocolli degli studi clinici (in corso e conclusi)
- Possono essere interrogati per patologia, tipo di farmaco, nome dello studio, tipo di studio, ecc
- Si contano circa 300 registri sul web

Registri di sperimentazioni cliniche - obiettivi

- Descrivere lo stato dell'arte
- Incoraggiare la collaborazione tra gruppi di ricerca
- Prevenire la duplicazione di sperimentazioni cliniche simili
- Pubblicare anche gli studi negativi
- Ridurre i bias di pubblicazione

The background features a large, solid blue circle on the right side. To its left, a grid of small blue squares is arranged in a pattern that tapers towards the bottom-left corner. The text is centered over these elements.

Thrombolytic agent

Purpose

To determine whether, separately or together, streptokinase and aspirin have clinical benefits in acute ischemic stroke similar to those in acute myocardial infarction.

Design

Study Design: Randomized, controlled, multi-center, open trial of 622 patients.

Inclusion Criteria: Acute ischemic stroke presenting within 6 hours of symptom onset.
 No clear indication for or contraindication against streptokinase or aspirin.

Exclusion Criteria: Intracerebral hemorrhage, severe coma without any purposeful motor response, rapid resolution of neurological symptoms, and any medical

Observational Aspirin Use and CVD in the Physicians' Health Study

This study is completed.

Sponsored by

[National Heart, Lung, and Blood Institute \(NHLBI\)](#)

▶ Purpose

To analyze existing data from the Physicians Health Study (PHS), a randomized primary prevention trial of low-dose aspirin and beta carotene conducted among 22,071 U.S. male physicians, to address questions concerning aspirin and cardiovascular (CV) disease that could not adequately be addressed during the randomized aspirin period.

Results

The randomized aspirin component of the Physicians' Health Study (PHS) was terminated early, after 5 years, primarily because of the emergence of a statistically extreme 44 percent reduction of first myocardial infarction (MI) among those assigned to aspirin. As a result, there were insufficient numbers of strokes or cardiovascular disease (CVD)-related deaths to evaluate these end points definitively. The analysis collected data on self-selected aspirin use until the beta carotene component ended as scheduled after 12 years. Posttrial use of aspirin was assessed at the 7-year follow-up among 18 496 participants with no previous reported CVD. Randomized and posttrial observational results in the PHS were compared, and differences between those self-selecting aspirin and those not were examined. At 7 years, 59.5 percent of participants without CVD reported self-selected aspirin use for at least 180 days per year, and 20.8 percent for 0 to 13 days per year. Use was significantly associated with family history of MI, hypertension, elevated cholesterol levels, body mass index, alcohol consumption, exercise, and use of vitamin E supplements. In multivariate analyses, self-selected aspirin use for at least 180 vs 0 to 13 days per year was associated with lower risk for subsequent MI, no relation with stroke, and significant reductions in CVD-related and total mortality. The authors concluded that these associations between self-selected aspirin use and CVD risk factors increase the likelihood of residual confounding and emphasize the need for large-scale randomized trials, such as the ongoing Women's Health Study, to detect reliably the most plausible small to moderate effects of aspirin in the primary prevention of stroke and CVD-related death.

Source of record	Cardiosource
Title of trial	Gruppo Italiano per lo Studio della Sopravvivenza nell'Infarto Miocardico - 3
Acronym	GISSI-3
Design/methodology	Randomized controlled trial.
Disease	Myocardial infarction (MI)
Purpose of trial	To evaluate the efficacy of a treatment with angiotensin converting enzyme (ACE) inhibitors and/or nitrates on 6-week mortality following acute MI; evaluation of the extent to which such a favourable effect on left ventricular (LV) function (measured at 6 weeks), if present, is maintained up to 6 months following the event: the evaluation is carried out on the combined endpoint of mortality and LV damage
Status	published
Further information	The Cardiosource trial records in the metaRegister were last updated on 21 February 2001. Click here to link to the Cardiosource site where you can obtain full details of this trial. The registry of randomized cardiovascular clinical trials on Cardiosource provides a unique resource containing more than 600 ongoing and recent trials, as well as a listing of major trials going back many years. The site requires registration; access to the clinical trials database (and several other services) is free.

INTERNATIONAL STANDARD RANDOMISED CONTROLLED TRIAL NUMBER (ISRCTN)

COMING SOON...

The International Standard Randomised Controlled Trial Number (**ISRCTN**) is a simple numeric system for the unique identification of trials worldwide. It will simplify the identification of trials and provide a unique number that can be used to track all publications and reports resulting from each trial.

Current Controlled Trials has offered to generate and record these numbers so that they are accessible via this website. Please [contact us](#) if you would like to receive further information about the ISRCTN scheme.

A brief introduction to the ISRCTN scheme has been prepared in [French](#), [German](#) and [Spanish](#), and other languages will be added.

metaRegister of Controlled Trials

Introduzione a *Current Controlled Trials* e *metaRegister of Controlled Trials*

"La registrazione di tutte le sperimentazioni cliniche non può essere più messa in discussione" (BMJ e The Lancet, ottobre 1999).

A cosa può servire il *metaRegister*?

- Assistere nella pianificazione di nuovi trial
- Evitare l'inutile duplicazione della ricerca
- Favorire la collaborazione tra ricercatori
- Ottimizzare la distribuzione dei fondi per la ricerca
- Facilitare ai pazienti l'accesso all'informazione e favorire il loro reclutamento per la partecipazione alle sperimentazioni cliniche
- Migliorare le opportunità per la ricerca metodologica
- Ridurre le discrepanze tra protocolli originali dei trial e risultati successivamente pubblicati
- Ridimensionare il bias di pubblicazione

A chi può essere utile il *metaRegister*?

Il sito *Current Controlled Trials* (<http://controlled-trials.com>) viene realizzato nell'ottobre del 1998 in risposta alla crescente domanda di maggiore trasparenza sulle sperimentazioni cliniche.

Il *metaRegister of Controlled Trials* (mRCT) aiuta a promuovere la disponibilità e lo scambio

d'informazioni sui trial condotti in tutte le aree assistenziali affinché:

- Ricercatori e soggetti finanziatori evitino di duplicare la ricerca e sprecare ingenti quantità di risorse
- Le revisioni sistematiche e le meta-analisi identifichino eventuali bias di pubblicazione
- Pazienti e medici possano disporre di un'informazione dettagliata ed accurata sui trattamenti, così da informare meglio le proprie decisioni
